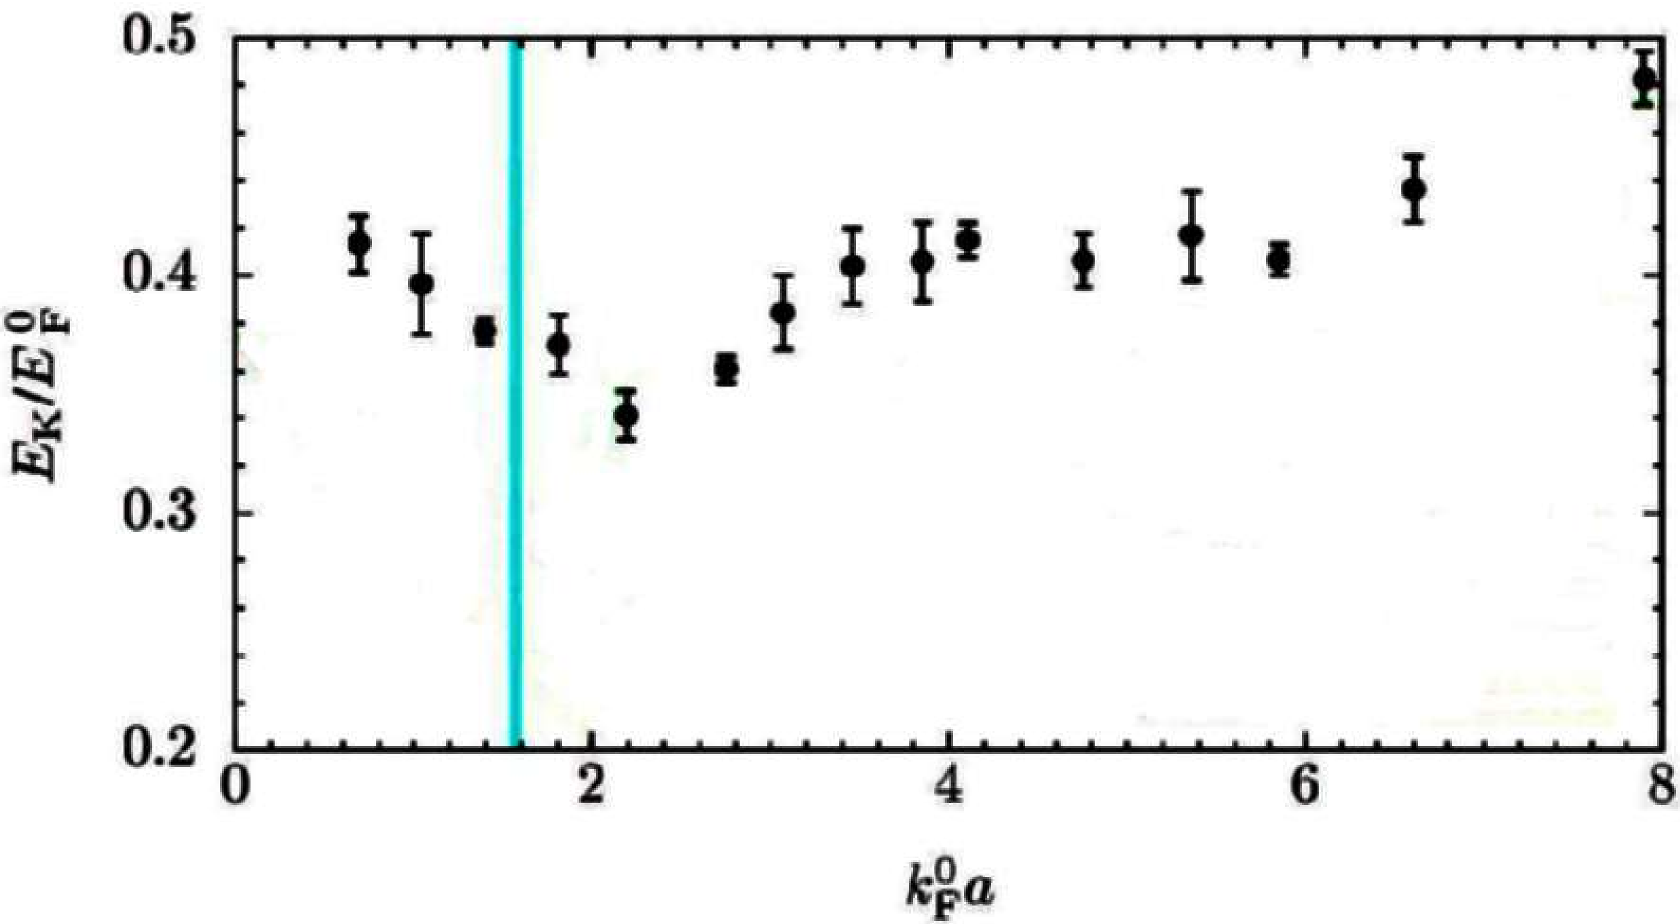
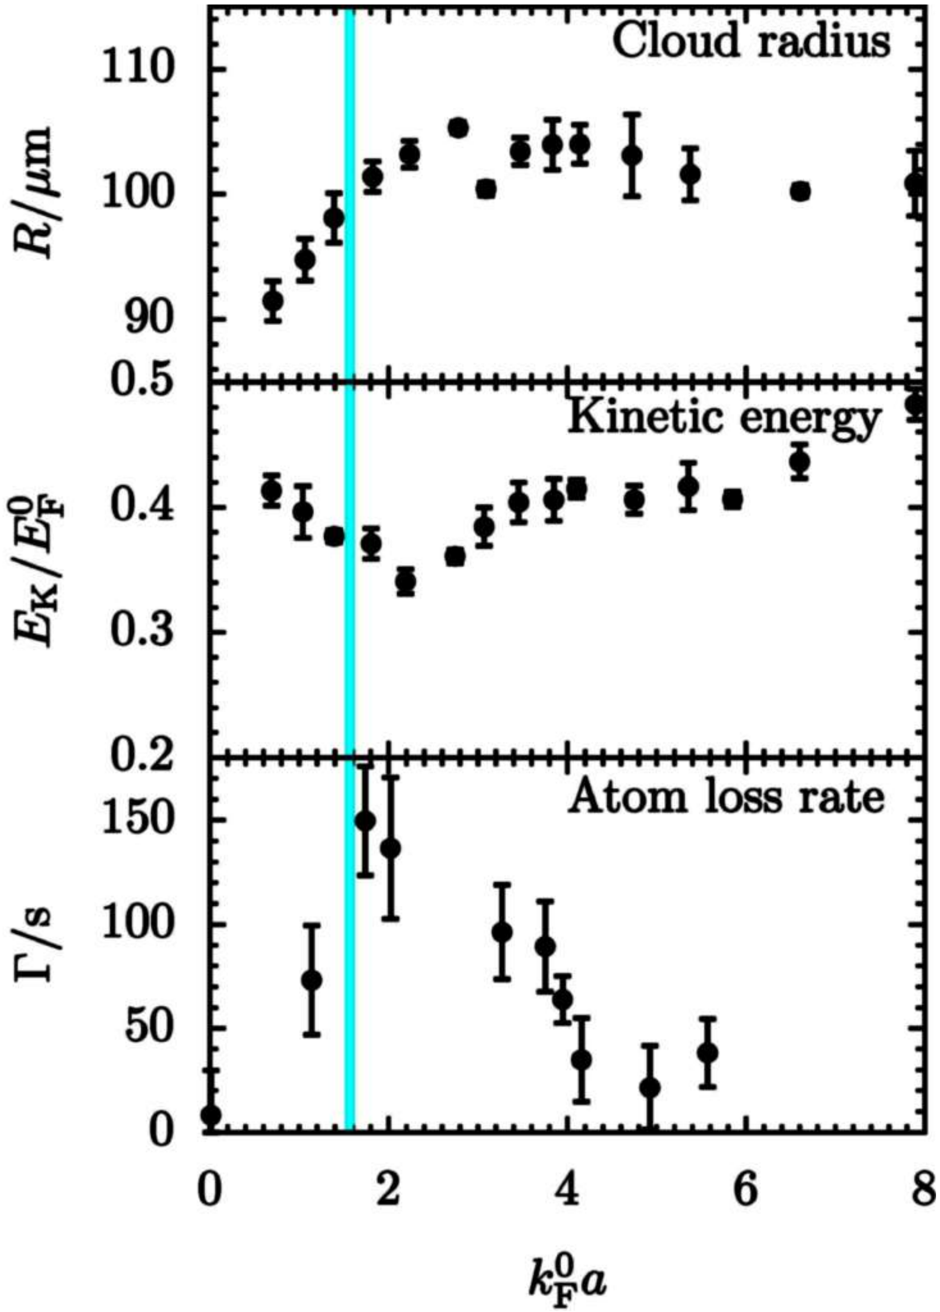
Experimental evidence for ferromagnetism

- Rise in kinetic energy at $k_F a \approx 2.2$



Jo, Lee, Choi, Christensen, Kim, Thywissen, Pritchard & Ketterle, Science **325**, 1521 (2009)

Further key experimental signatures



$$E_K \propto n^{5/3}$$

$$\Gamma \propto (k_F a)^6 n_\uparrow n_\downarrow (n_\uparrow + n_\downarrow)$$

Jo, Lee, Choi, Christensen, Kim, Thywissen, Pritchard & Ketterle, Science **325**, 1521 (2009)

Free energy kernel

$$Z=\int D\psi\exp\left(-\iint d\tau\, d\mathbf{r}\sum_{\sigma}\bar{\psi}_{\sigma}(-i\hat{\omega}+\hat{\epsilon}-\mu)\psi_{\sigma}-g\,\bar{\psi}_{\uparrow}\bar{\psi}_{\downarrow}\psi_{\downarrow}\psi_{\uparrow}\right)$$

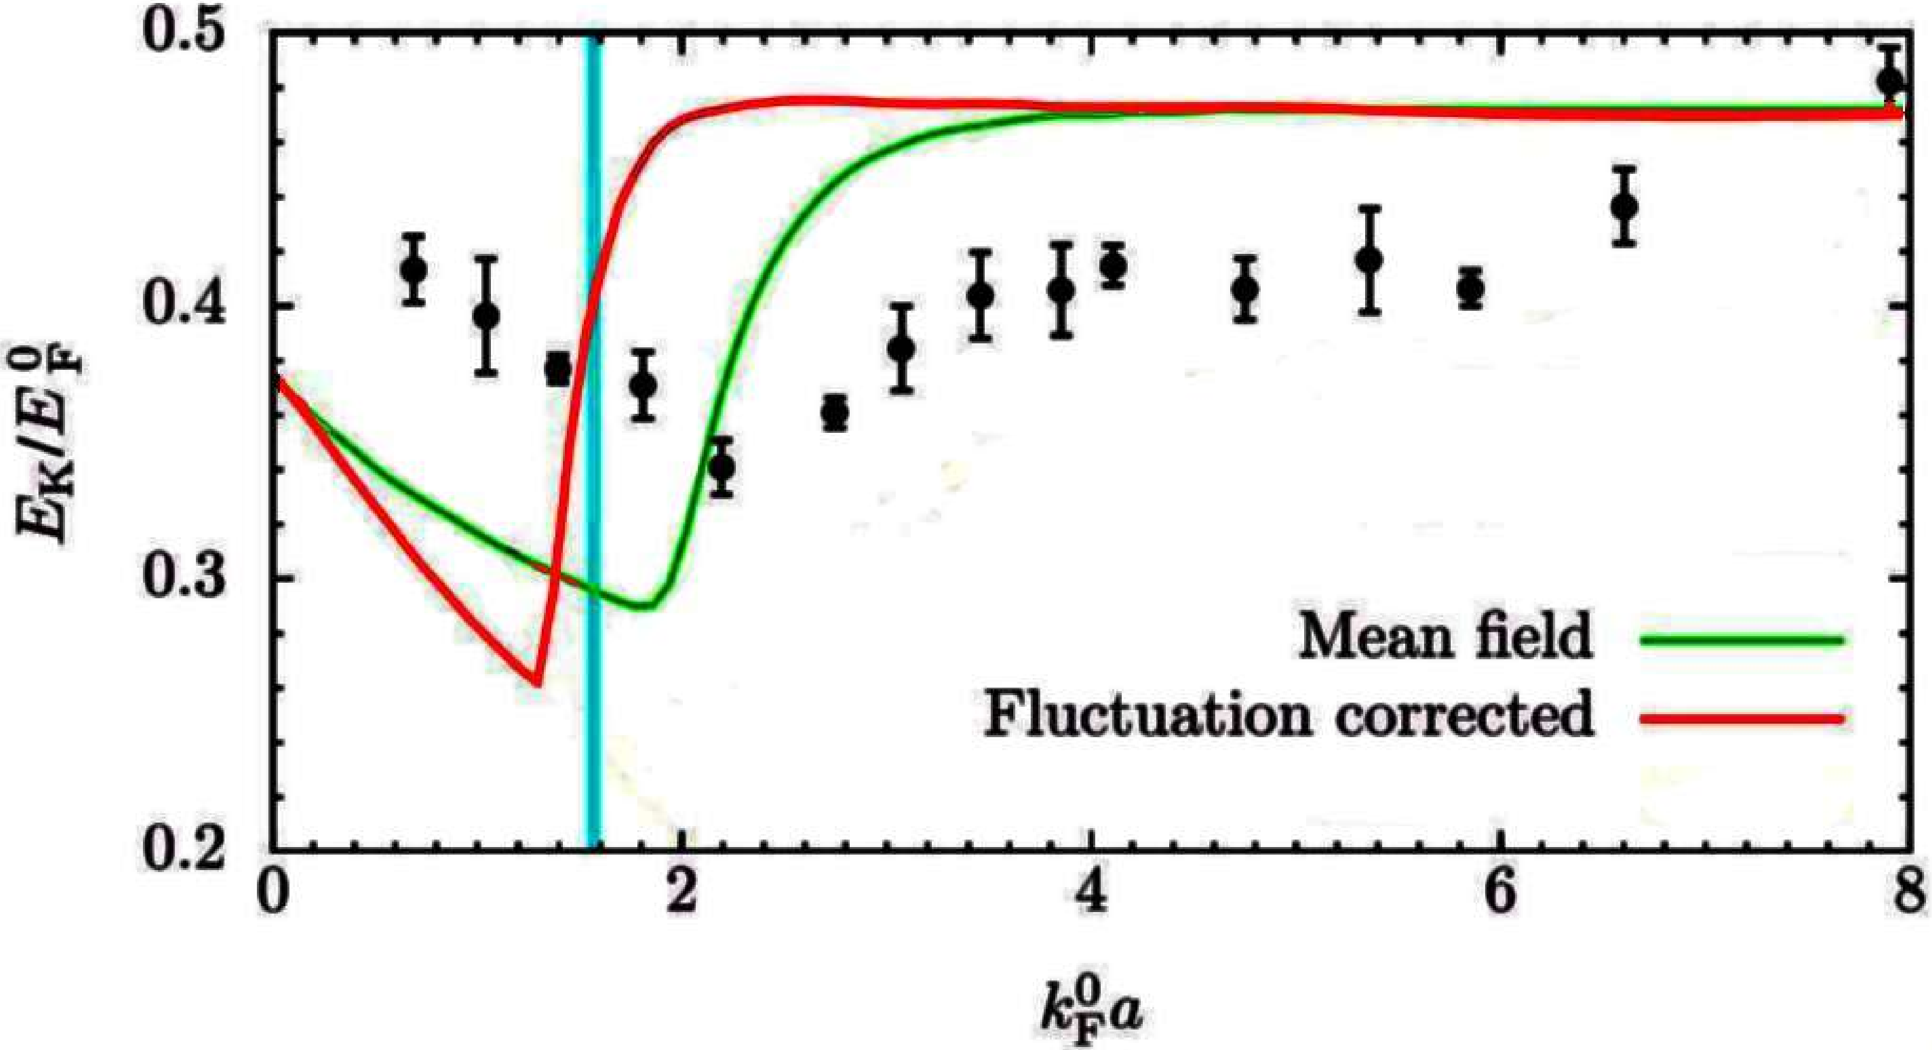
- Integrate over fluctuations in magnetization and density and develop a perturbation theory in interaction strength

$$F=F_0+\frac{1-g\nu}{2\nu}m^2+um^4+vm^6+g^2\left(r\,m^2+w\,m^4\ln|m|\right) \qquad k_F a_{\text{crit}}=1.05$$

- First order transition[1] verified by *ab initio* Quantum Monte Carlo calculations[2]

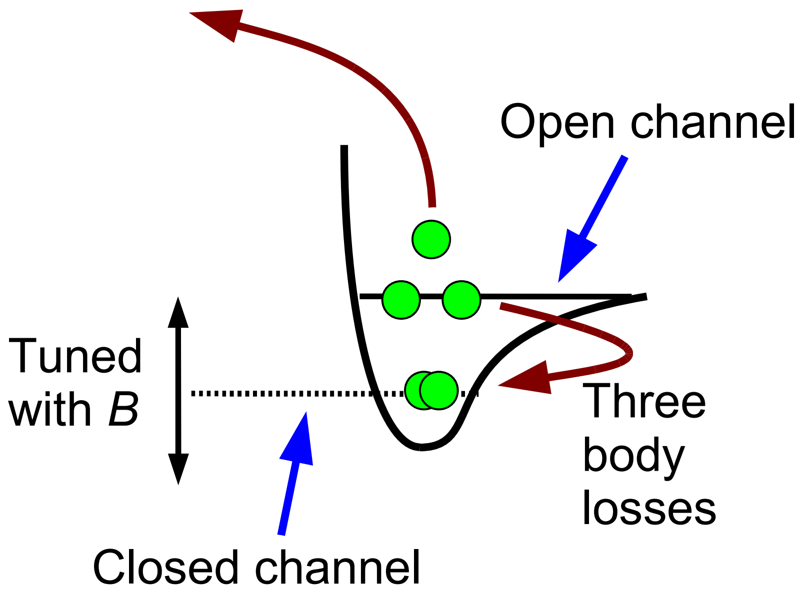
[1]Abrikosov (1958), Duine & MacDonald (2005), Belitz *et al*. Z. Phys. B (1997) & Conduit & Simons (2009)
[2]Conduit & Simons, Phys. Rev. Lett. **103**, 207201 (2009)

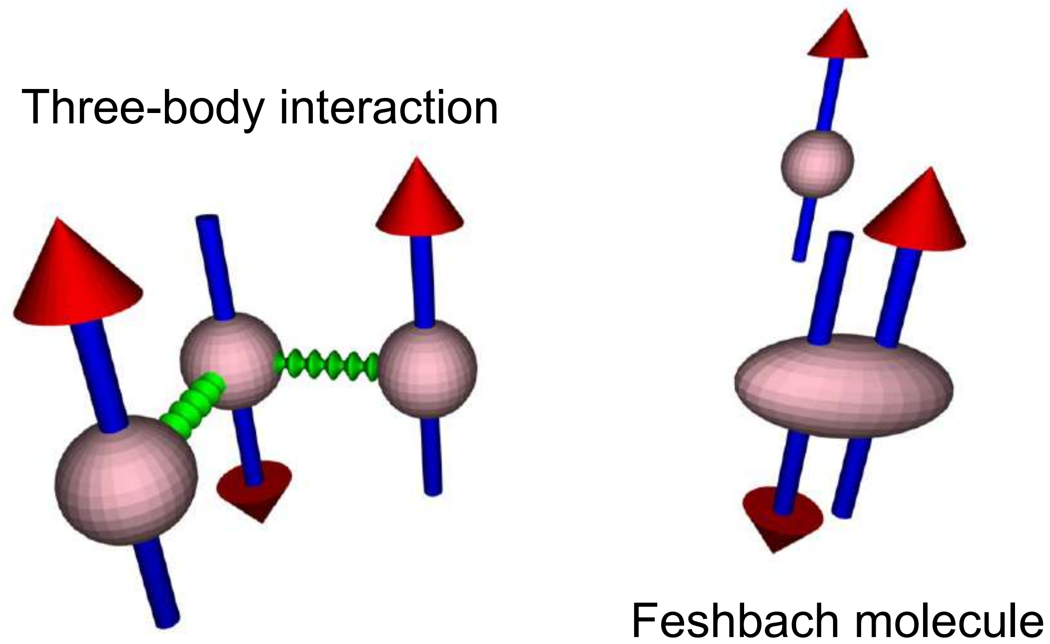
Theoretical prediction of the kinetic energy



Conduit & Simons, Phys. Rev. Lett. **103**, 200403 (2009)

Three body losses





- Loss not only causes mean-field reduction in density [Y31.00002] but also damps quantum fluctuations
- In boson systems, three-body scattering drives the formation of a Tonks-Girardeau gas [Syassen *et al*., Science **320**, 1329 (2009)]

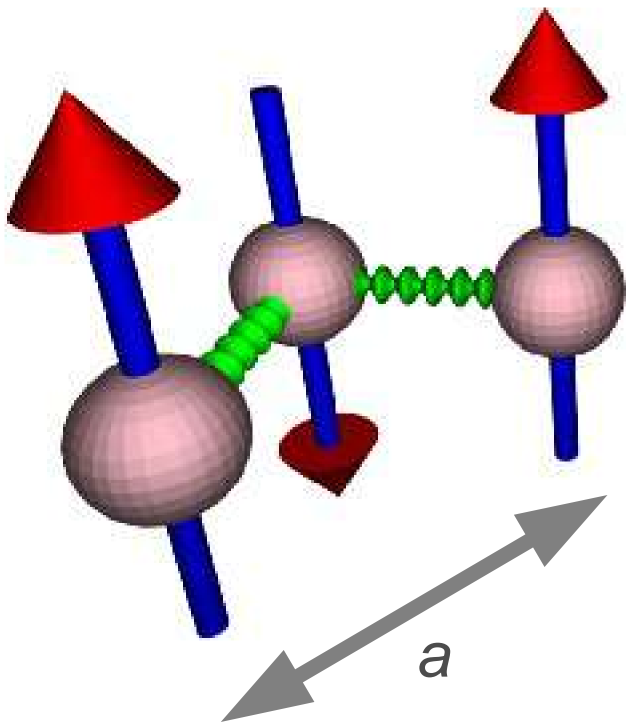
Damping of fluctuations by atom loss

- Atom loss rate $(k_F a)^6 n_\uparrow n_\downarrow (n_\uparrow + n_\downarrow)$ is

  $\lambda'\chi(\mathbf{r}-\mathbf{r}')[c_\uparrow^\dagger(\mathbf{r}')c_\uparrow(\mathbf{r}') + c_\downarrow^\dagger(\mathbf{r}')c_\downarrow(\mathbf{r}')]c_\uparrow^\dagger(\mathbf{r})c_\downarrow^\dagger(\mathbf{r})c_\downarrow(\mathbf{r})c_\uparrow(\mathbf{r})$

- A mean-field approximation, $\overline{N} = n_\uparrow(\mathbf{r}') + n_\downarrow(\mathbf{r}')$ places loss on same footing as interactions

  $S_{\text{int}} = (g + i\lambda\overline{N})c_\uparrow^\dagger(\mathbf{r})c_\downarrow^\dagger(\mathbf{r})c_\downarrow(\mathbf{r})c_\uparrow(\mathbf{r})$

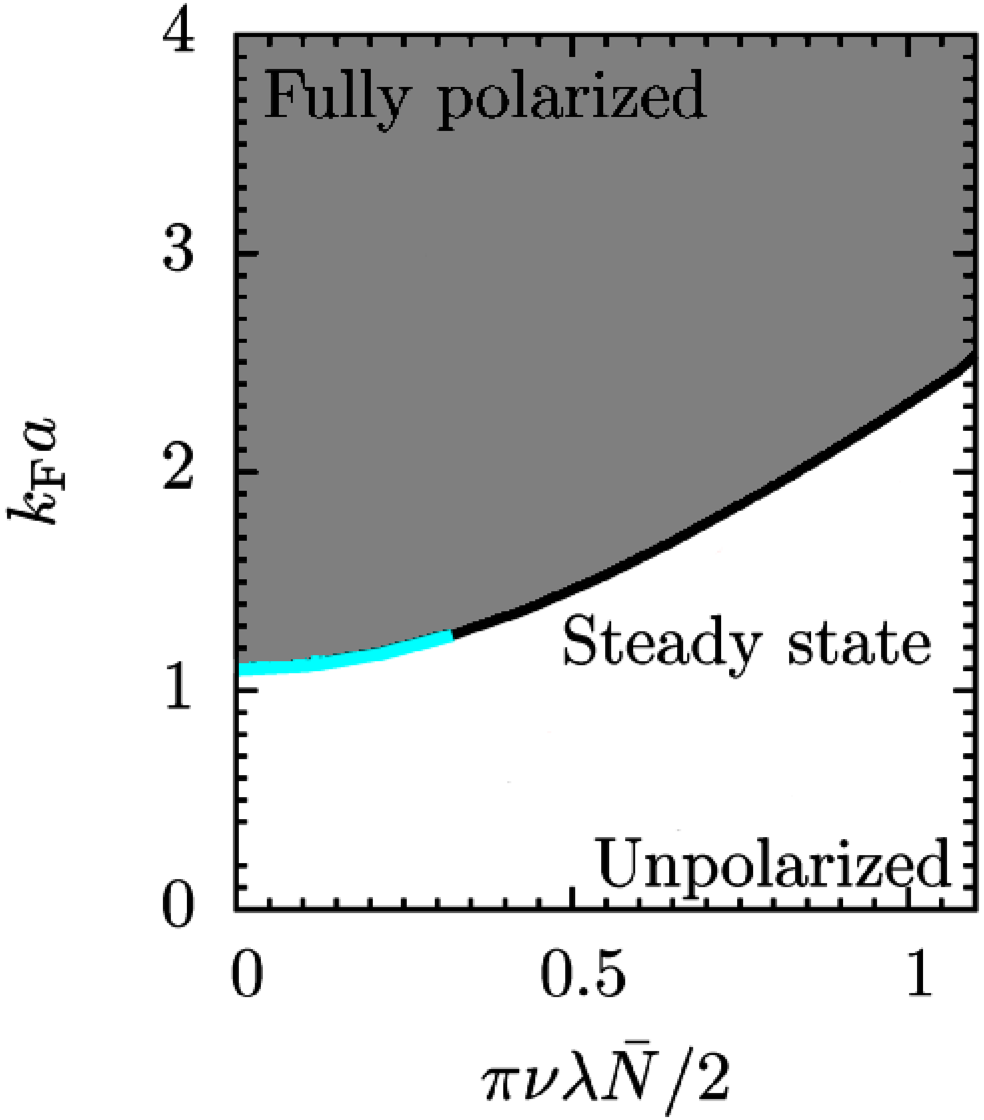


- Loss damps fluctuations so inhibits the transition

$$F = F_0 + \frac{1-g\nu}{2\nu} m^2 + u m^4 + v m^6 + \left(g^2 - \lambda^2 \overline{N}^2\right)\left(r\, m^2 + w\, m^4 \ln|m|\right)$$

Phase boundary with atom loss

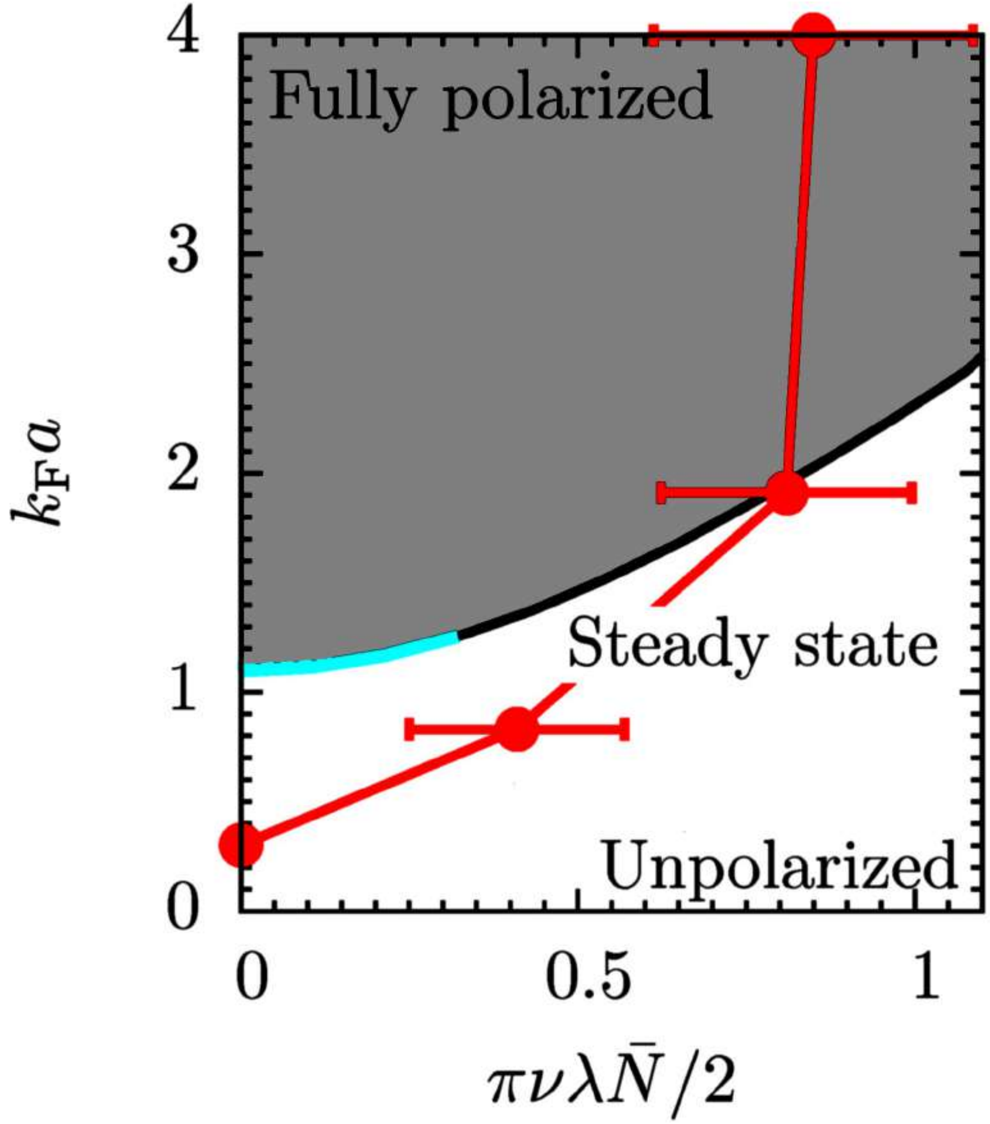
- Atom loss raises the interaction strength required for ferromagnetism



Conduit & Altman, arXiv: 0911.2839

Interaction renormalization with atom loss

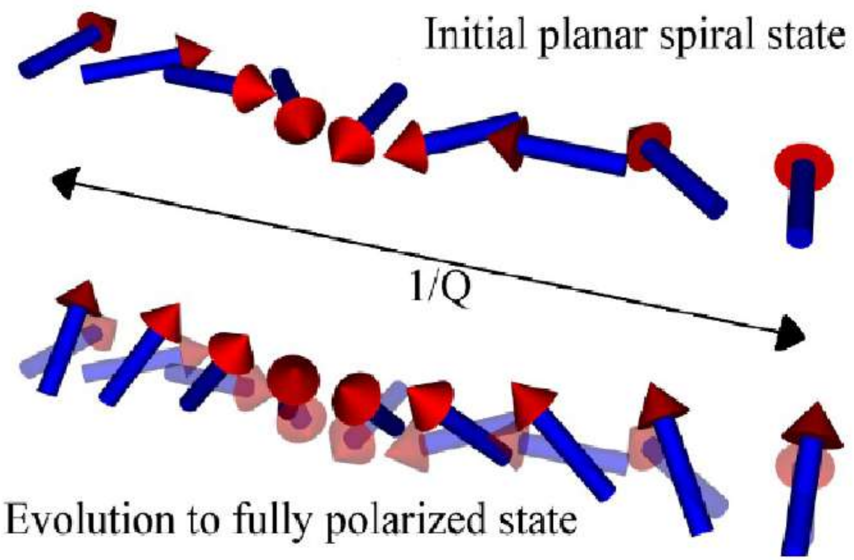
- Comparing to experimental atom loss indicates transition at $k_F a \approx 2$

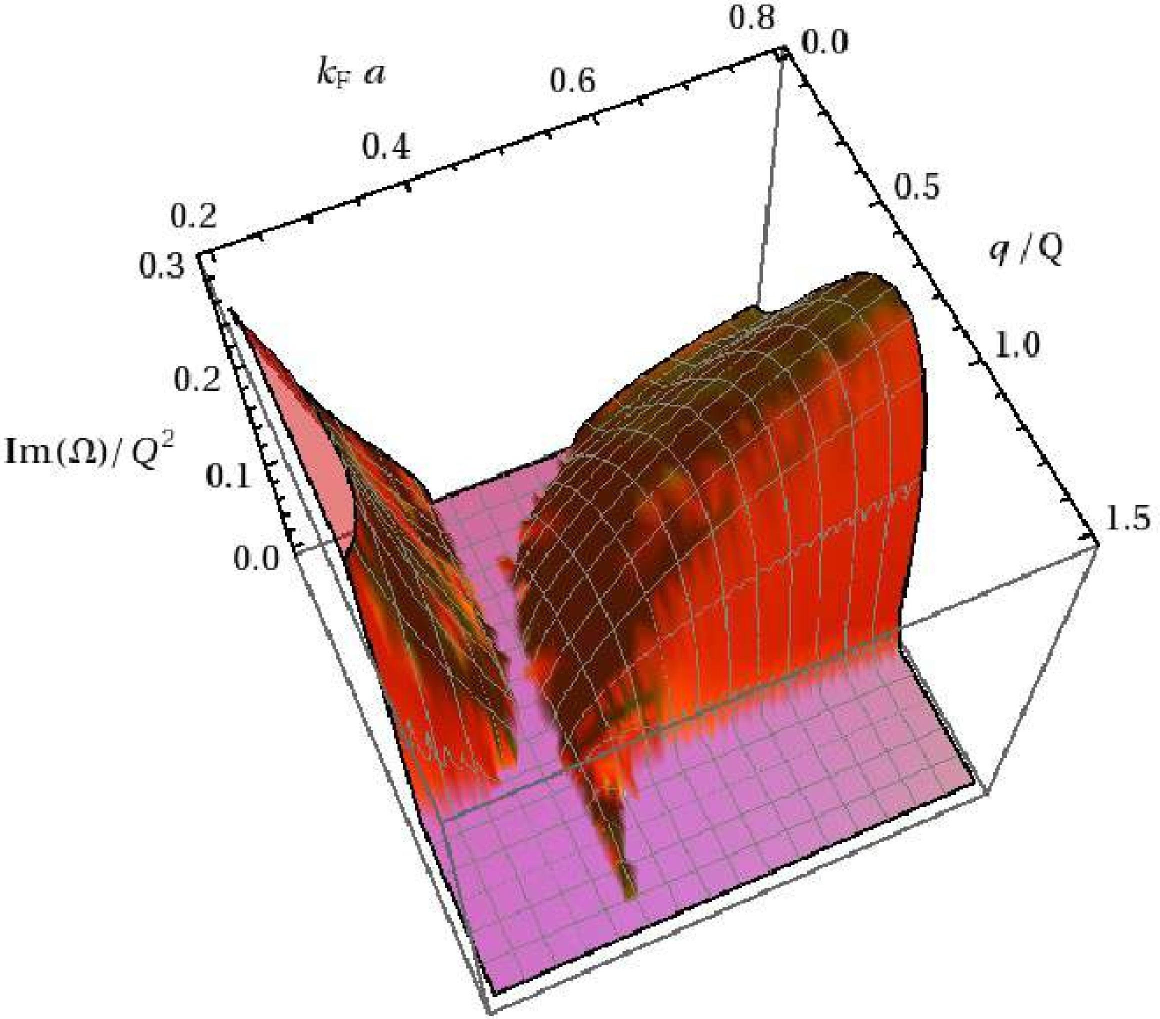


Conduit & Altman, arXiv: 0911.2839; Huckans *et al*. PRL **102**, 165302 (2009)

Alternative strategy: spin spiral

- Prepare gas in spin spiral and follow evolution into fully polarized state





Summary

- Equilibrium theory provides a qualitative description of the ferromagnetic transition
- Discrepancy in the interaction strength could be accounted for by the renormalization due to atom loss
- Atom loss can be avoided by starting the gas in a fully polarized state

Damping of fluctuations by atom loss

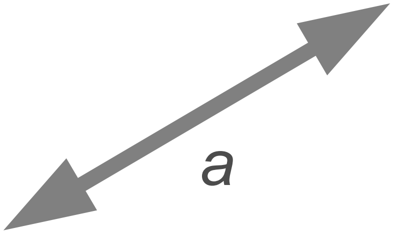
- Atom loss rate is

$$\lambda'\chi(\mathbf{r}-\mathbf{r}')[c_\uparrow^\dagger(\mathbf{r}')c_\uparrow(\mathbf{r}') + c_\downarrow^\dagger(\mathbf{r}')c_\downarrow(\mathbf{r}')]c_\uparrow^\dagger(\mathbf{r})c_\downarrow^\dagger(\mathbf{r})c_\downarrow(\mathbf{r})c_\uparrow(\mathbf{r})$$

- A mean-field approximation, $\overline{N} = n_\uparrow(\mathbf{r}') + n_\downarrow(\mathbf{r}')$ places loss on same footing as interactions

$$S_{\text{int}} = (g + i\lambda\overline{N})c_\uparrow^\dagger(\mathbf{r})c_\downarrow^\dagger(\mathbf{r})c_\downarrow(\mathbf{r})c_\uparrow(\mathbf{r})$$

- Also include atom source $-i\gamma c_\sigma^\dagger c_\sigma$ to ensure gas remains at equilibrium



- Loss damps fluctuations so inhibits the transition

$$F = F_0 + \frac{1-g\nu}{2\nu}m^2 + um^4 + vm^6 + \left(g^2 - \lambda^2\overline{N}^2\right)\left(r\,m^2 + w\,m^4\ln|m|\right)$$

Equilibrium study of ferromagnetism

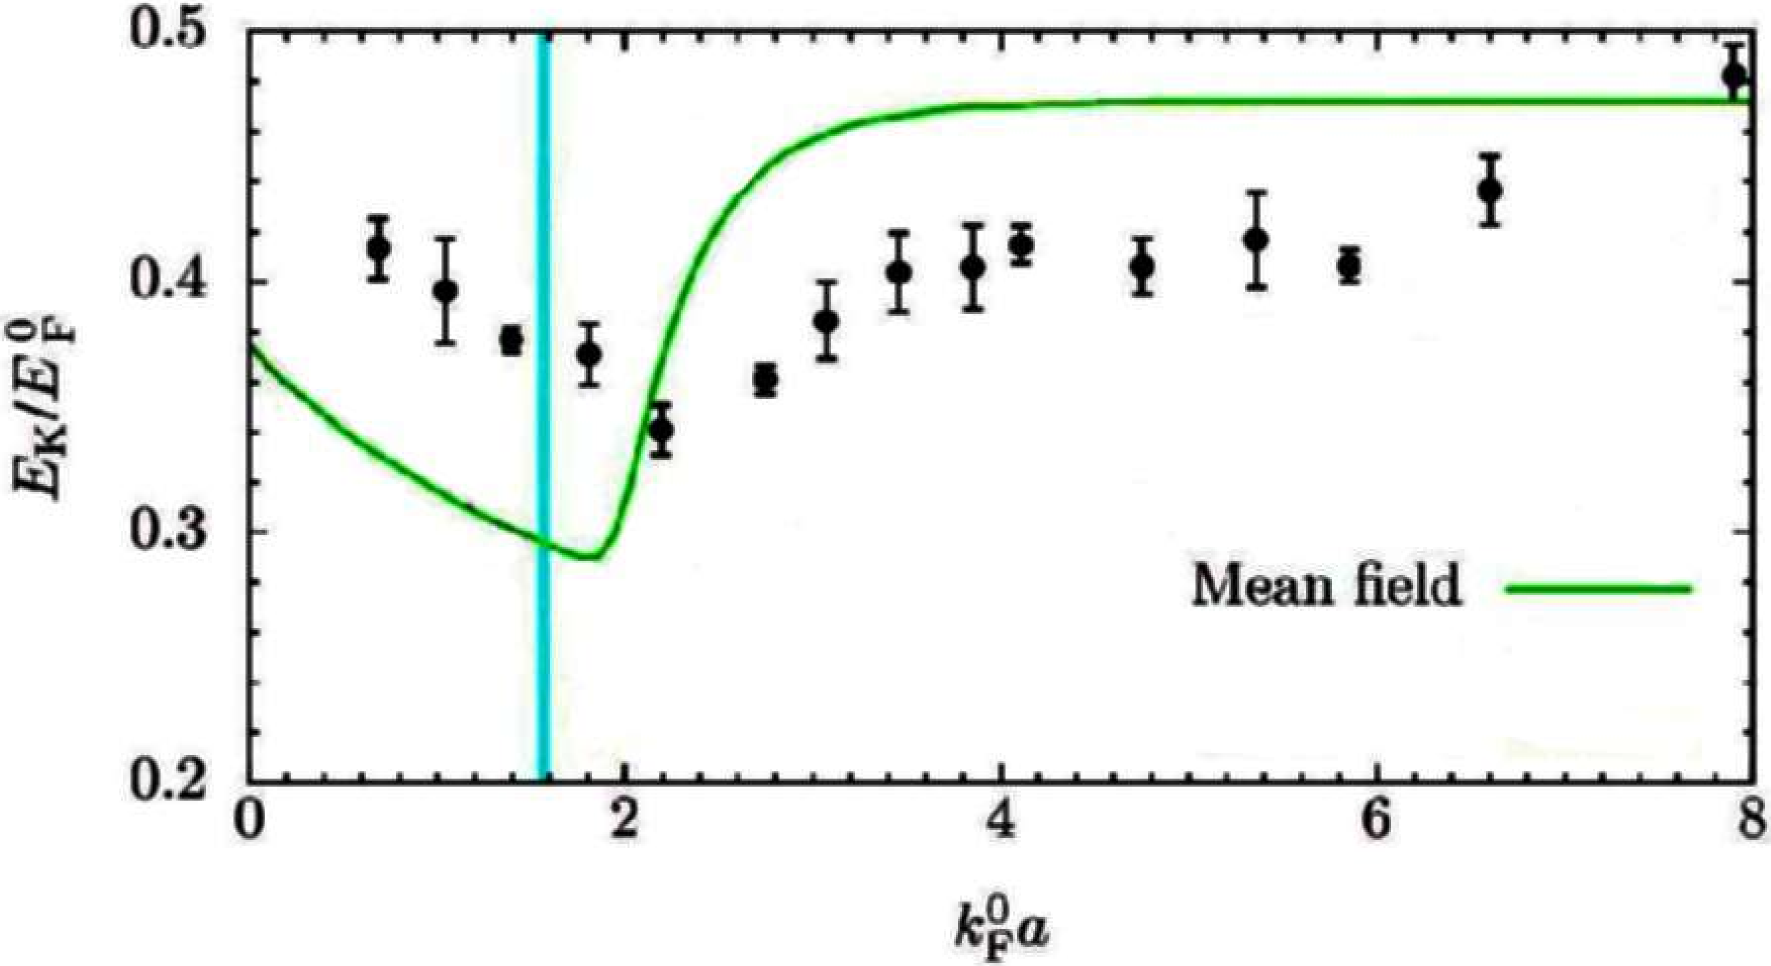
$$Z = \int D\psi \exp\left(-\iint d\tau\, d\boldsymbol{r} \sum_{\sigma} \bar{\psi}_{\sigma}(-i\hat{\omega}+\hat{\epsilon}-\mu)\psi_{\sigma} - g\,\bar{\psi}_{\uparrow}\bar{\psi}_{\downarrow}\psi_{\downarrow}\psi_{\uparrow}\right)$$

- Decouple with the average magnetisation *m* gives the Stoner criterion

$$F = F_0 + \frac{1-g\nu}{2\nu} m^2 + u m^4 + v m^6$$

Mean-field analysis & consequences of trap

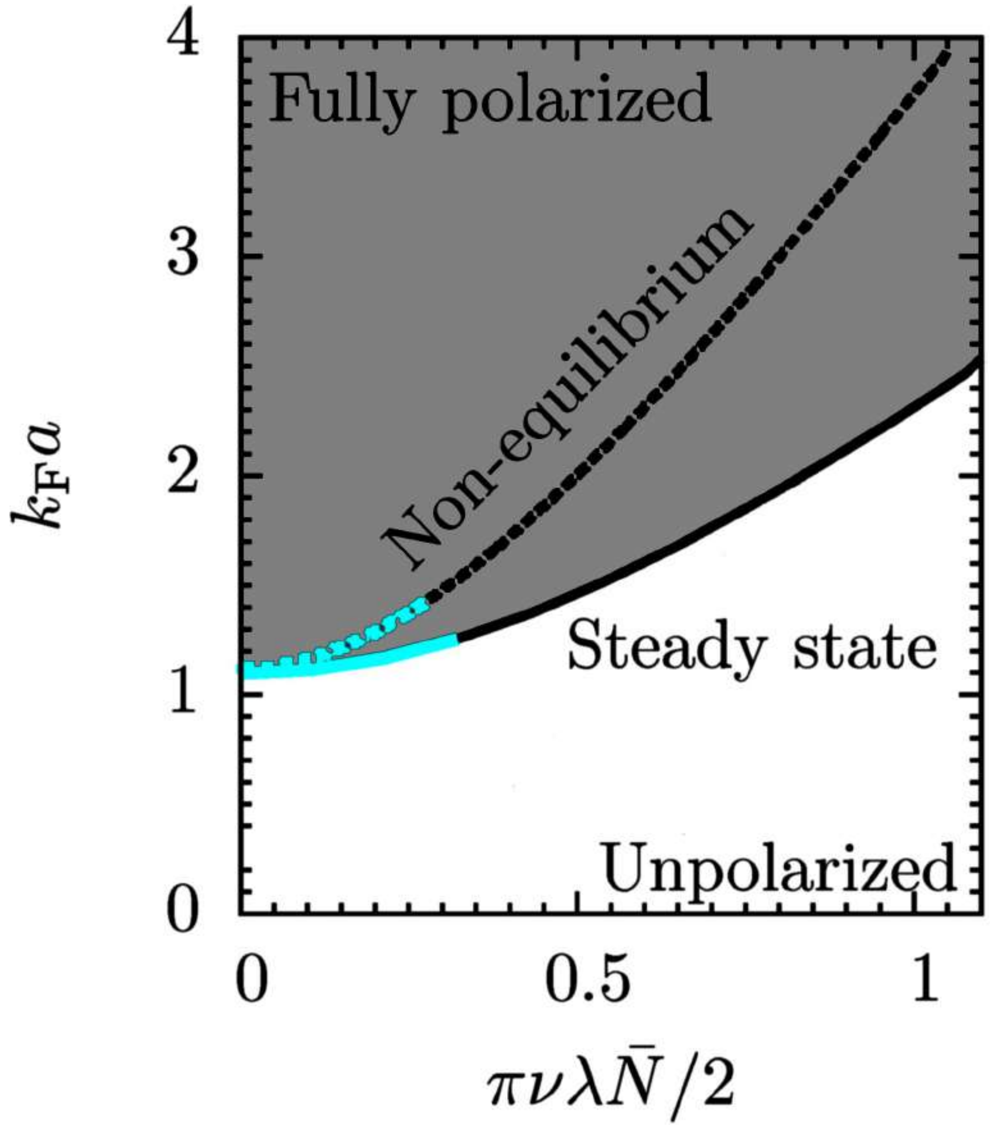
- Recovers qualitative behavior[1] but transition at $k_F a$=1.8 instead of $k_F a$=2.2



[1]LeBlanc, Thywissen, Burkov & Paramekanti, Phys. Rev. A **80**, 013607 (2009) & Conduit & Simons, Phys. Rev. Lett. **103**, 200403 (2009)

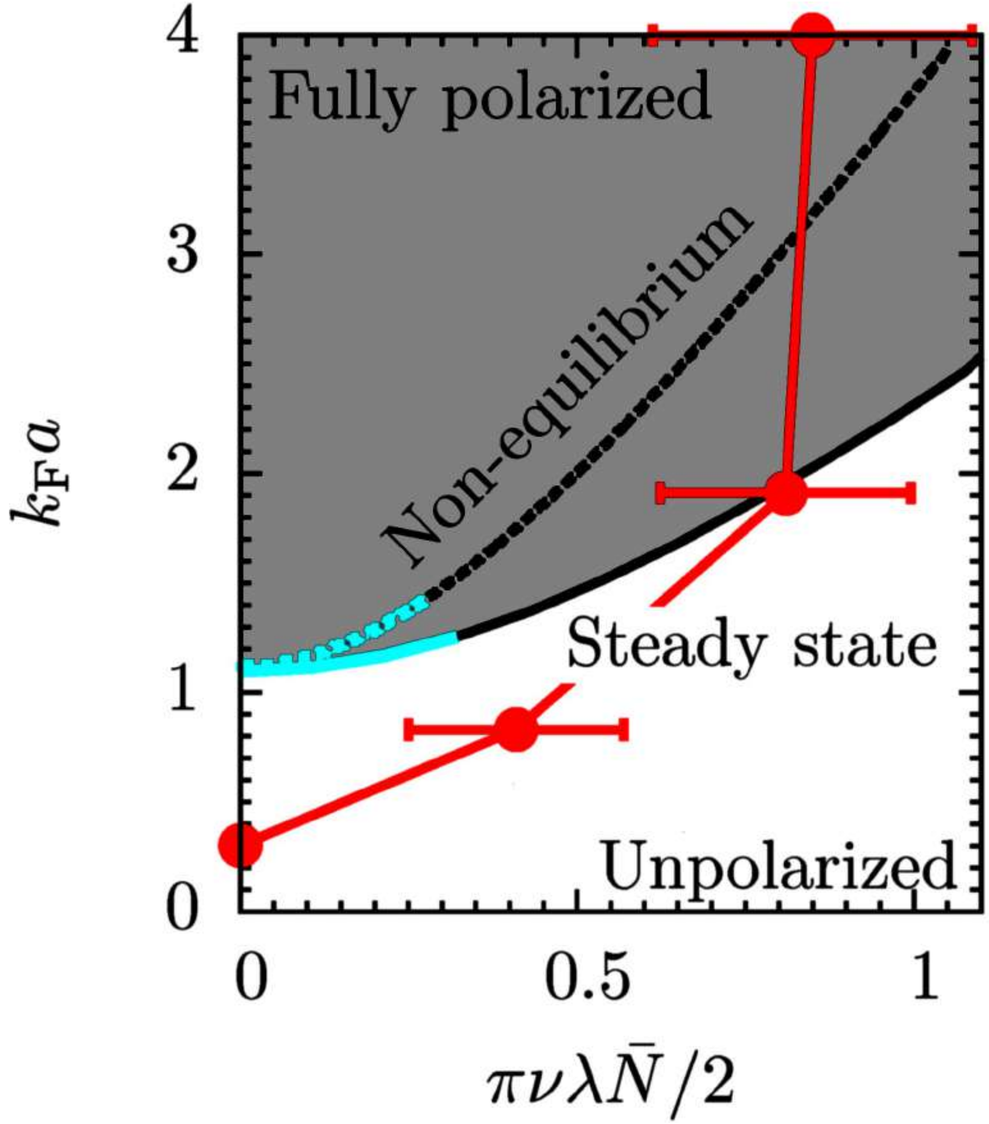
Phase boundary with atom loss

- Atom loss raises the interaction strength required for ferromagnetism



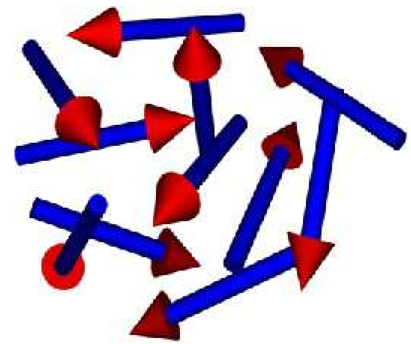
Conduit & Altman, arXiv: 0911.2839

Interaction renormalization with atom loss



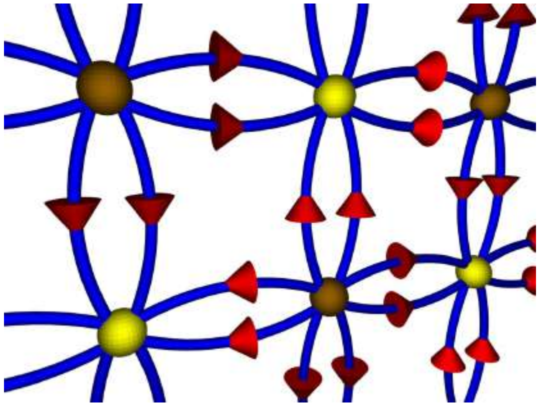
Conduit & Altman, arXiv: 0911.2839; Huckans *et al*. PRL **102**, 165302 (2009)

Condensation of topological defects

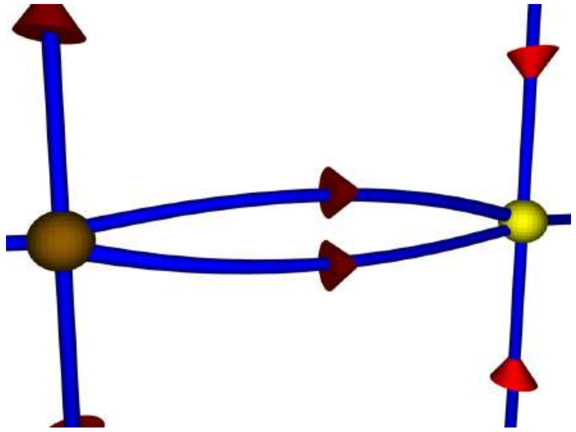


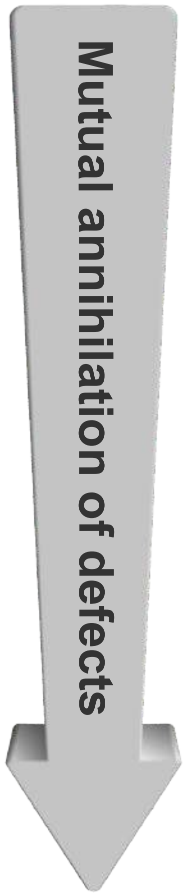
Start in paramagnetic state and ramp up interaction strength

- Defects freeze out from disordered state



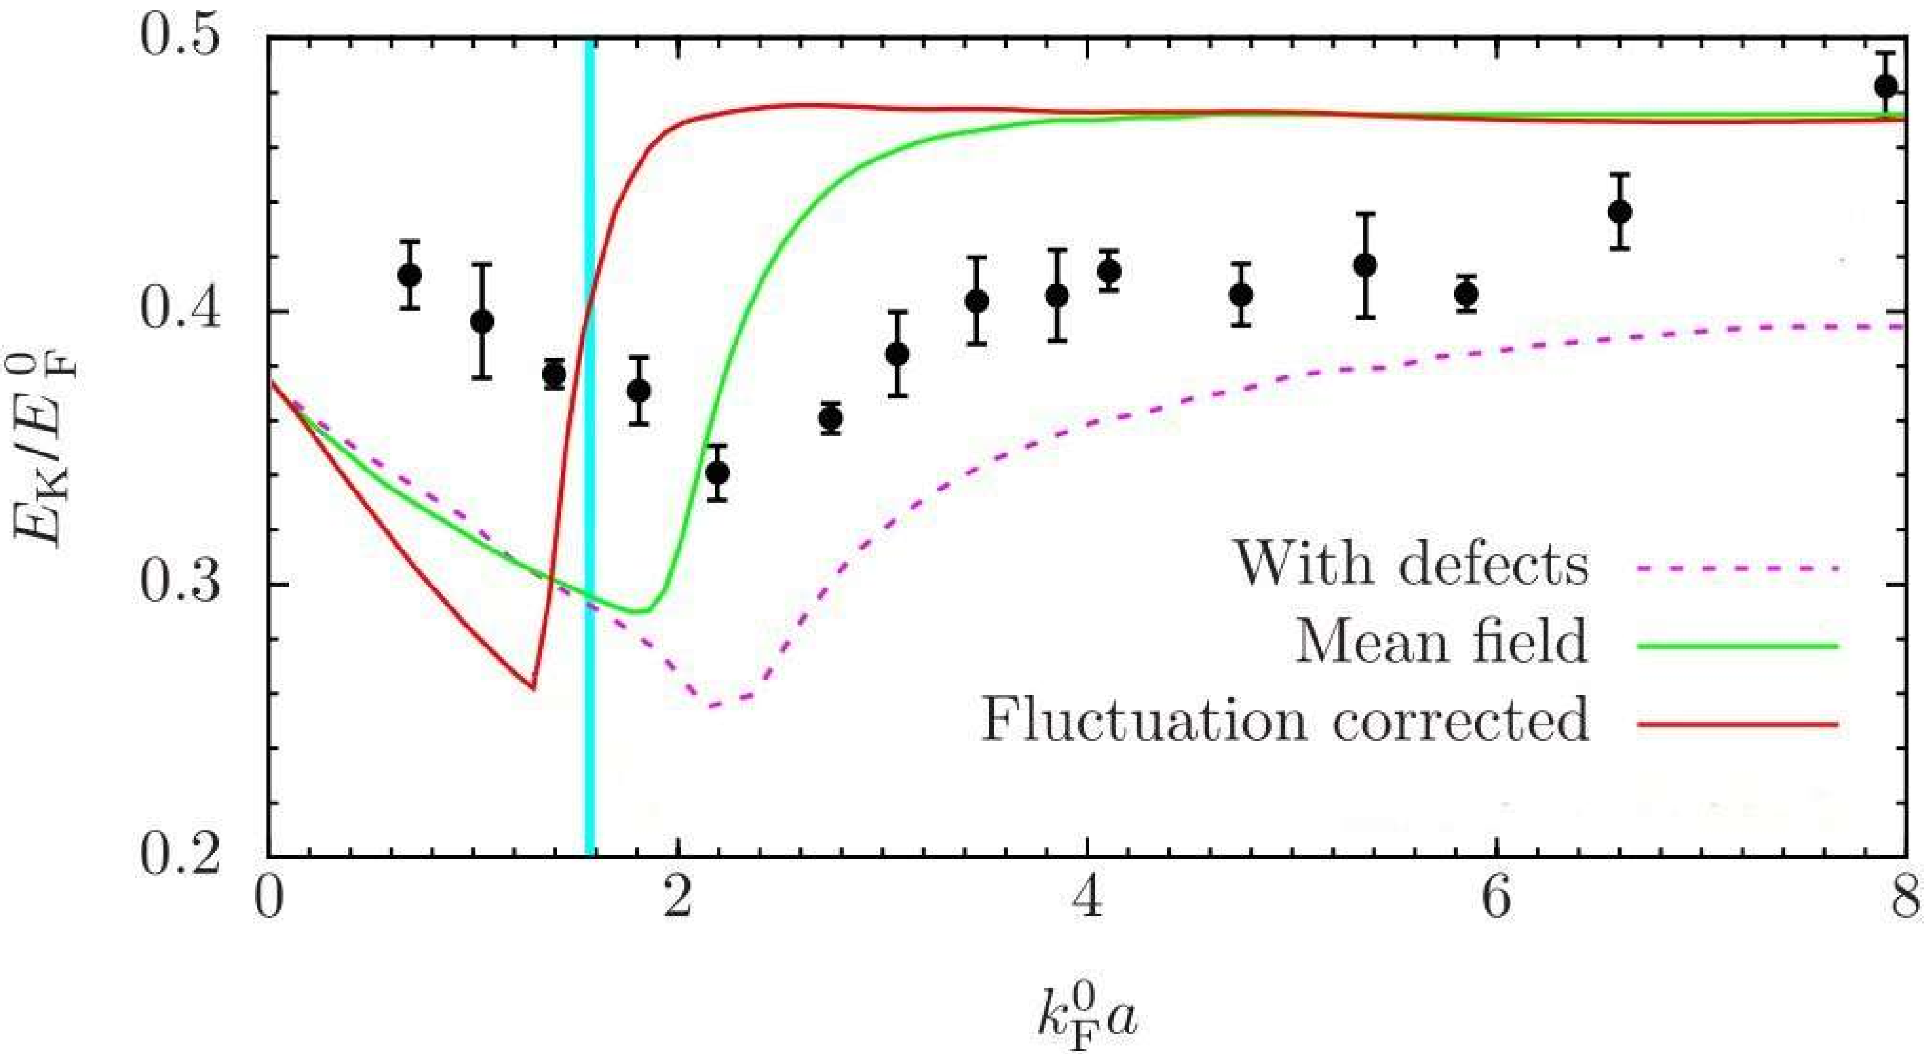
- Defect annihilation hinders the formation of the ferromagnetic phase thus raising the required interaction strength
- Defect radius $L \sim t^{1/2}$ [Bray, Adv. Phys. **43**, 357 (1994)]





Condensation of topological defects

- Condensation of defects inhibits the transition



Conduit & Simons, Phys. Rev. Lett. **103**, 200403 (2009)

First order phase transition and Quantum Monte Carlo verification

- First order transition into uniform phase with TCP

- QMC also sees first order transition

Summary of equilibrium results

Momentum distribution

New approach to fluctuation corrections

$$Z=\int D\psi \exp\left(-\int \sum_{\sigma} \bar{\psi}_{\sigma}(-i\omega+\epsilon-\mu)\psi_{\sigma}-g\int \bar{\psi}_{\uparrow}\bar{\psi}_{\downarrow}\psi_{\downarrow}\psi_{\uparrow}\right)$$

- Analytic strategy:

  1) Decouple in both the density and spin channels (previous approaches employ only spin)

  2) Integrate out electrons

  3) Expand about uniform magnetisation

  4) Expand density and magnetisation fluctuations to second order

  5) Integrate out density and magnetisation fluctuations
- Aim to uncover connection to second order perturbation theory
- Unravel origin of logarithmic divergence in energy and relation to tricritical point structure

Analytical method

- System free energy $F=-k_B T \ln Z$ is found via the partition function

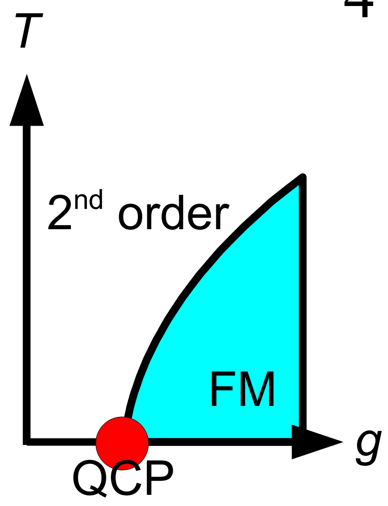
$$Z=\int D\psi \exp\left(-\int \sum_\sigma \bar{\psi}_\sigma(-i\omega+\epsilon-\mu)\psi_\sigma - g\int \bar{\psi}_\uparrow \bar{\psi}_\downarrow \psi_\downarrow \psi_\uparrow\right)$$

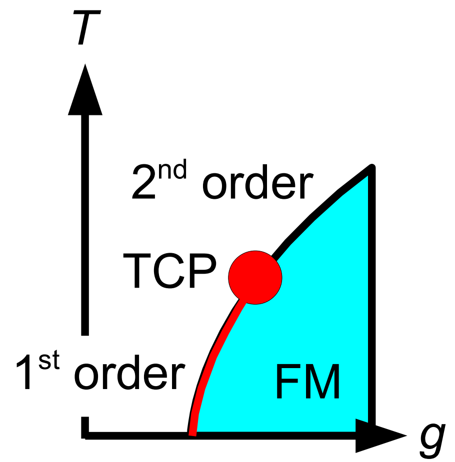
- Decouple using only the average magnetisation $m=\bar{\psi}_\downarrow \psi_\uparrow - \bar{\psi}_\uparrow \psi_\downarrow$

  gives $F \propto (1-g\nu)m^2$ i.e. the Stoner criterion

- Belitz-Kirkpatrick-Vojta (soft particle-hole & magnetisation) [Belitz *et al.* Z. Phys. B 1997]

$$F=\frac{1}{2}\left(|\omega|/\Gamma_q+r+q^2\right)m^2+\frac{u}{4}m^4\ln(m^2+T^2)+\cdots-hm$$





Quantum Monte Carlo verification

- First order transition into uniform phase with TCP

- QMC also sees first order transition

Cold atomic gases — spin

- Two fermionic atom species have a *pseudo-spin*:

^{6}Li	m_F=1/2	maps to	spin 1/2
^{6}Li	m_F=-1/2	maps to	spin -1/2

- The up-and down spin particles *cannot* interchange — population imbalance is fixed. Possible spin states are:

$\|\uparrow\uparrow\rangle$	S=1, S_z=1	State not possible as S_z has changed
$\|\downarrow\downarrow\rangle$	S=1, S_z=-1	State not possible as S_z has changed
$(\|\uparrow\downarrow\rangle+\|\downarrow\uparrow\rangle)/\sqrt{2}$	S=1, S_z=0	Magnetic moment in plane
$(\|\uparrow\downarrow\rangle-\|\downarrow\uparrow\rangle)/\sqrt{2}$	S=0, S_z=0	Non-magnetic state

- Ferromagnetism, if favourable, must form in-plane

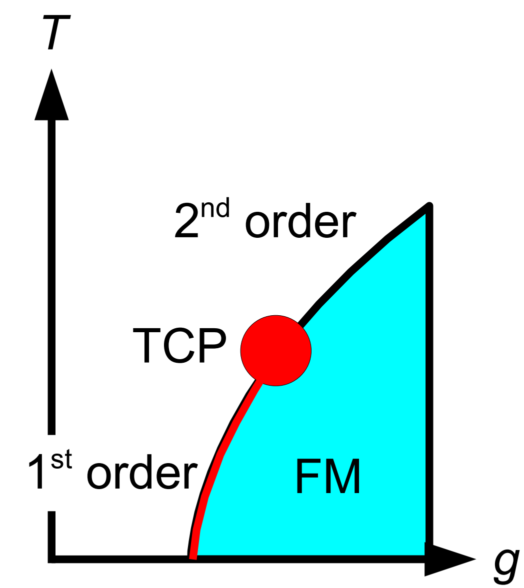
Particle-hole perspective

- To second order in *g* the free energy is

$$F=\sum_{\sigma,\boldsymbol{k}}\epsilon_{\boldsymbol{k}}^{\sigma}n(\epsilon_{\boldsymbol{k}}^{\sigma})+gN^{\uparrow}N^{\downarrow}$$

$$-\frac{2g^2}{V^3}\sum_{\boldsymbol{p}}\int\int\frac{\rho^{\uparrow}(\boldsymbol{p},\epsilon_{\uparrow})\rho^{\downarrow}(-\boldsymbol{p},\epsilon_{\downarrow})}{\epsilon_{\uparrow}+\epsilon_{\downarrow}}d\epsilon_{\uparrow}d\epsilon_{\downarrow}$$

$$+\frac{2g^2}{V^3}\sum_{\boldsymbol{k}_{1,2,3,4}}\frac{n(\epsilon_{\boldsymbol{k}_1}^{\uparrow})n(\epsilon_{\boldsymbol{k}_2}^{\downarrow})}{\epsilon_{\boldsymbol{k}_1}^{\uparrow}+\epsilon_{\boldsymbol{k}_2}^{\downarrow}-\epsilon_{\boldsymbol{k}_3}^{\uparrow}-\epsilon_{\boldsymbol{k}_4}^{\downarrow}}\delta(\boldsymbol{k}_1+\boldsymbol{k}_2-\boldsymbol{k}_3-\boldsymbol{k}_3)$$



with $\epsilon_{\boldsymbol{k}}^{\sigma}=\epsilon_{\boldsymbol{k}}+\sigma gm$ and a particle-hole density of states

$$\rho^{\sigma}(\boldsymbol{p},\epsilon)=\sum_{\boldsymbol{k}}n(\epsilon_{\boldsymbol{k}+\boldsymbol{p}/2}^{\sigma})\left[1-n(\epsilon_{\boldsymbol{k}-\boldsymbol{p}/2}^{\sigma})\right]\delta\left(\epsilon-\epsilon_{\boldsymbol{k}+\boldsymbol{p}/2}^{\sigma}+\epsilon_{\boldsymbol{k}-\boldsymbol{p}/2}^{\sigma}\right)$$

- Enhanced particle-hole phase space at zero magnetisation drives transition first order
- Recover $m^4\ln m^2$ at *T*=0
- Links quantum fluctuation to second order perturbation approach[1]
